Lecture Notes on Dynamic Modeling

Peter Thompson

Florida International University

Preliminary and Incomplete

This version: March 2004

Contents

Chapter 1. Differential Equations 1

1. Linear differential equations 3
2. Nonlinear differential equation 11
3. Systems of differential equations 19

Further reading 29

References 29

Chapter 2. Optimal Control 31

1. An economic interpretation of optimal control theory 31
2. The Hamiltonian and the maximum principle 36
3. Alternative problem types and the transversalty condition 42
4. Multiple controls and state variables 45
5. When are necessary conditions also sufficient 47
6. Infinite planning horizons 52
7. Infinite horizon problems and steady states 56
8. Applications from growth 60

Further reading 72

References 73

Chapter 3. Difference Equations 74

1. Deterministic difference equations 75
2. Rational expectations and uncertainty 84
3. Nonlinear difference equations 100

Further reading 118

References 119

Chapter 4. Introduction to Dynamic Programming 120
1. Deterministic finite-horizon problems 120
2. Deterministic infinite-horizon problems 124
3. Dyamic programming and optimal control 147
4. Stochastic dynamic programming 150
5. Approximations, algebraic and numerical 158
Further reading 160
References 160.

Chapter 5. Applications of Dynamic Programming 161
1. Discrete choice problems 162
2. Optimal stopping problems 166
3. Continous choice models 190
4. Transactions costs 191
5. Time inconsistency 195
Further reading 196
References 196
